HOW TO USE THIS MODEL

Ashworth & Kensington Holdings plc — Integrated Financial Model

Version:	v1.0
Last Updated:	July 2026
Author:	Deepika Kumari
Purpose:	Educational Portfolio Project

1. Overview

This workbook is a fully-linked, three-statement financial model for a fictional holding company with three segments (Heritage Textiles, Private Wealth Advisory, Fine Estates). It builds a bottom-up revenue forecast, rolls it through the Income Statement, Balance Sheet, and Cash Flow Statement, and produces two independent valuations — a Discounted Cash Flow and a Comparable Company analysis — which are reconciled in a single valuation range. Every number in the model is either a hard-coded

2. Color Conventions (used consistently on every sheet)

■ **Blue text**	A hard-coded input you can safely change — historical actuals, assumptions, or scenario values.
■ **Black text**	A formula. Do not overwrite — it calculates automatically from other cells.
■ **Green text**	A link that pulls a value from another sheet, so you can trace where a number came from.
■ **Gold fill**	A key output, subtotal, or the “selected” scenario value — the number you most want to look at on that sheet.

3. How the Model Flows

▸ **Scenarios**	Choose Bear / Base / Bull from the dropdown — this is the master switch for the entire model.
▸ **Assumptions**	Macro, margin, and capital-structure drivers. Scenario adjustments are layered on here.
▸ **Revenue Build**	Units Sold × Average Selling Price, by segment, rolls up to Total Revenue.
▸ **Income Statement**	Revenue flows down to Net Income using the margin assumptions and Debt Schedule interest.
▸ **Working Capital / Debt Schedu**	Supporting schedules for AR/Inventory/AP (DSO/DIO/DPO) and the debt roll-forward.
▸ **Balance Sheet / Cash Flow**	Fully articulated and mechanically balanced — see the Checks tab.
▸ **DCF Valuation / Comparables**	Two independent valuations, reconciled on the Comparables tab's valuation range.
▸ **Sensitivity / Econometrics**	WACC × growth data table, CAPM beta regression, and macro regressions.
▸ **Checks**	Ten automated integrity tests — everything should read ✅ PASS.

4. Running a Scenario

Go to the Scenarios tab → click the dropdown in cell C6 → choose Bear, Base, or Bull. Every projected assumption (volume growth, pricing, margins, WACC, terminal growth) updates immediately via CHOOSE() / INDEX() / MATCH() formulas, and the change flows all the way through to the Dashboard KPIs, the DCF implied share price, and the Comparables valuation range.

5. Named Ranges (Name Box or Ctrl+G to jump)

`Scenario_Selector`	The Bear/Base/Bull dropdown cell
`WACC`	Scenario-adjusted discount rate
`Terminal_Growth_Rate`	Scenario-adjusted terminal growth rate
`Implied_Share_Price_DCF`	DCF Valuation tab's headline output
`Implied_Valuation_Range_Low`	Low end of the all-methods valuation range
`Implied_Valuation_Range_High`	High end of the all-methods valuation range

6. Notes & Disclaimer

Ashworth & Kensington Holdings plc is a fictional company created for illustrative and educational
